

Making a difference one train journey at a time

Choosing the train instead of a car could save the same carbon as boiling a kettle 455 times.

nationalrail.co.uk/greener

The average train journey is 37.3km, emitting 1.32kg CO2e per passenger per journey. Making this journey by the average car emits 4.14kg CO2e per passenger (based on the average of all cars on the road of various types and engines, and average occupancy). This saves 2.82kg CO2e which is equivalent to boiling up to 455 cups of water in a kettle.
