

Making a difference one train journey at a time

An average train journey puts nearly five times less carbon emissions into the air than making this journey by car.

nationalrail.co.uk/greener

A person travelling in an average car produces O.167kg CO2e per km (based on the average emissions of all cars on the road of various types and engines), while National Rail trains on average produce O.035kg CO2e per passenger per km. This means the average car is 4.7 times (nearly 5 times) more polluting.
